

PROJECT **BLACK**™

THE FUTURE OF COMMERCIAL OPEN PLAN HEATING

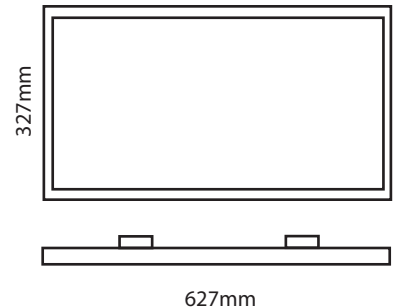

Designed for open plan offices where shared environments can often mean a conflict in heating and cooling.

People all experience heat differently. What feels warm to one person is too cold to another. This results in space heating that never quite works for everyone. As a result there are often expensive callouts to maintenance staff to adjust major heating plants causing higher bills and often more complaints.

Our unique design of under desk heater uses a graphite based black body radiant element to deliver 'direct heat' to occupants. This empowers them to take control and become responsible for their own heating.

It's more energy efficient as the panel does not waste energy heating the air. It transmits direct-heat via radiant waves.

This gently warms occupants laps and legs which in turns warms the Femoral artery allowing the persons entire body temperature to rise to a comfy level when sitting stationery.

- Energy efficient, only 135w
- Easy to install and no hardwiring required
- Soft silent radiant warmth to gently heat the occupant
- Reduce open plan heating complaints
